Canadian Senior Mathematics Contest / Concours canadien de niveau supérieur

Ian Payne (Chair / président), University of Waterloo, Waterloo, ON
Diana Castañeda Santos, Vancouver, BC
Lee Fryer-Davis, Cameron Heights C.I., Kitchener, ON
Sean Gasiorek, California Polytechnic State University, San Luis Obispo, CA
Kee Ip, Crescent School, Toronto, ON
Denes Jakob, Sir Allan MacNab S.S., Hamilton, ON
Paul Leistra, Guido de Bres Christian H.S., Hamilton, ON
Comfort Mintah, University of Waterloo, Waterloo, ON
Jocelyn Procopio, Citadel H.S., Halifax, ON
Joe West, University of Waterloo, Waterloo, ON

Canadian Intermediate Mathematics Contest / Concours canadien de niveau intermédiaire

Carrie Knoll (Chair / présidente), University of Waterloo, Waterloo, ON
Ed Barbeau, Toronto, ON
Robert Garbary, University of Waterloo, Waterloo, ON
William John, Sutherland S.S., North Vancouver, BC
Sachin Kotecha, University of Waterloo, Waterloo, ON
Brian McBain, Lambton Kent District School Board, Forest, ON
Karen Sullivan, Blenheim, ON
Marcel te Bokkel, York Region District School Board, Newmarket, ON

The Centre for Education in Mathematics and Computing is pleased to announce the results of the 2023 Canadian Senior and Intermediate Mathematics Contests.

Our congratulations go to all who participated in this year's CSMC and CIMC. The averages on the CSMC and CIMC were 25.2 and 29.7, respectively.

As always, we would like to thank the hard-working Problems Committees. Many of the members of these Committees are active secondary school teachers who volunteer their time and contribute dozens of hours of expertise. Without their intriguing and sometimes amusing problems, these Contests would not be possible.

As always, we would like to thank all of the educators who arranged for their students to participate in these contests. We would also like to thank all participants for your interest in mathematics. We hope that the papers provided you with some interesting mathematics to think about and play with. Thank you for your support! Please continue to encourage your colleagues and fellow students to become involved in our activities.

Le Centre d'éducation en mathématiques et en informatique à d'annoncer les résultats du Conours canadiens de mathématiques de niveau supérieur et intermédiaire 2023.

Nos félicitations vont à tous les participants du CCMS et du CCMI de cette année. Les moyennes sur le CSMC et le CIMC étaient de 25,2 et 29,7, respectivement.

Nous aimerions surtout remercier les Comités de problèmes pour leur dur travail. Plusieurs membres de ces Comités sont des enseignant(e)s d'école secondaire actifs qui offre leur temps et contribuent des douzaines d'heures d'expertise. Sans leurs problèmes perspicaces et amusants, ces Concours ne seraient pas possibles.

Comme toujours, nous tenons à remercier tout particulièrement les éducateurs et les éducatrices qui ont organisé la participation de leurs élèves à ces concours. Nous aimerions également remercier tous les participants et participantes pour leur intérêt pour les mathématiques. Nous espérons que les concours vous ont offert des mathématiques intéressantes qui vous ont amusées et portées à réfléchir. Merci pour votre soutien continué!

CANADIAN SENIOR MATHEMATICS CONTEST
Part A

1. Participants who knew which small integers were prime were quite successful on this problem. However, many participants were unsure which integers are prime and which are not. In particular, 2 is prime and 0 and 1 are not prime. Some participants found the correct primes that add to 31 but forgot to multiply them together.
   Average: 4.1

2. Well done. The most common mistakes were allowing 0 to be the hundreds digit or not allowing 0 to be the tens digit.
   Average: 3.9

3. Most participants approached this problem visually and were able to determine the coordinates $(8, 15)$ as one possibility for the point P. Some struggled with the symmetry of the second answer and placed the other possibility for point P in the wrong quadrant. Participants who solved this algebraically tended to do quite well or made small algebraic errors.
   Average: 3.7

4. Most participants obtained the equation $10x + 5y + z = 120$ and found some possible ordered triples. Determining a method of systematically counting all such triples was more difficult. Common errors include allowing x, y and z to equal 0, not using a systematic approach for counting the number of possible ordered triples, and making incorrect assumptions about the pattern generated by the number of possible ordered triples.
   Average: 2.5

5. Most participants who attempted this problem used a trial and error approach. Many were able to find one or two pairs using this approach; however, some students did manage to find all six solutions this way. We saw many participants factor $p^2 + 5p + 6$ into $(p + 3)(p + 2)$ and conclude that $p = -3$ or $p = -2$. These students would usualy only find the pairs $(0, -2)$, $(4, -2)$, $(0, -3)$, $(3, -3)$ and would miss the pairs $(3, 1)$ and $(4, 1)$. For the students who solved this problem but did not use trial and error, most did so as we do in our solution. We did see a few correct solutions where students completed the square to get an equation like $(r - p)^2 + (r - 6)^2 + (p + 5)^2 = 49$, then partitioned 49 into a sum of perfect squares and analyzed cases.
   Average: 0.9

6. The vast majority of participants knew the formula for the volume of a square-based pyramid, but determining which pyramids to consider was the key step in this problem. Successful participants noticed that the desired volume was composed of two square-based pyramids, one of which is twice the height of the other. There were some interesting approaches using similar triangles or trigonometry to determine the distances of various line segments. Additionally, students who translated or "projected" the three-dimensional problem to a two-dimensional problem could then more easily coordinatize their approach
   Average: 0.5

Part B

1. Parts (a) and (b) were well done. Common errors in (c) include not recognizing the isosceles right-angled triangle, and thus writing incorrect expressions for the length of AP, or using incorrect proportional relationships between side lengths. In (d), some generated overly complicated expressions for the areas of the trapezoids and made algebraic errors while attempting to simplify and solve.
   Average: 6.5

Comments on the Contests

2. Part (a) was well done. A common incorrect answer was to give an answer of $47 - 1 = 46$. In part (b), a very common mistake was to not recognize that the x-coordinate must be a multiple of 3 in order for the point to be a lattice point. Participants would then go on and calculate that $b = 74$. However, the line with this value of b would in fact have only 5 lattice points in the region. Part (c) was challenging and was not attempted by many.
   Average: 2.2

3. Many participants got the correct answer to part (a) by correctly setting up and solving two equations in two unknowns. Some participants could determine a valid sequence in part (b), but proving why it was valid required more insight and care in their solutions. The key step in the proof involved showing a contradiction that arises when one side of equation is odd and the other side is even. Part (c) was rarely attempted, though a few participants did leverage their attempts at part (b) to make some inroads to solving this problem.
   Average: 0.8

Comments on the Contests

CANADIAN INTERMEDIATE MATHEMATICS CONTEST
Part A

1. This problem was very well done. Almost all participants were able to calculate the correct elapsed time.
   Average: 4.8

2. Well done. Two common incorrect answers were 9 and $\frac{9}{4}$. Arithmetic errors were not uncommon. Other errors included interpreting ♦ as a number, not an operation ignoring the definition of the ♦ operation and treating it as regular multiplication, or assuming that ♦ represented either addition, subtraction, multiplication or division, and trying to find which one it was.
   Average: 4.7

3. Well done. Some participants did not find the missing side lengths and only added together the expressions from the existing labels to find the perimeter. Some participants calculated the bottom missing side as $5x + 1 - 3x$, missing that they needed to subtract 2 as well. Some participants only determined one of the two missing sides when calculating the perimeter. Some participants made mathematical errors when solving the equation for x. Some participants misunderstood what the perimeter of an irregular polygon means.
   Average: 4.1

4. Some participants were not able to parse the question to understand that they needed to create a larger cube to deal with its faces. Many tried to solve it by drawing a net. This often led to only part marks. Many participants obtained a final answer 567 by adding the numbers on all of the faces of all 27 of the small cubes.
   Average: 1.8

5. This question was challenging for many. Some used a total walking time of 7 hours, forgetting to subtract the one hour of rest at R. Others calculated the total distance hiked from P to R and then forgot to double this distance for the return trip. Some obtained a correct equation that would lead to the final answer, but then struggled to solve this equation.
   Average: 1.6

6. This was a challenging problem. Overall, most participants struggled to recognize that an expression for d_C is dependent on the location of point C relative to points A and B. Some had success by finding a pattern. Specifically, they counted the number of points having different (smaller) values of d_C. For example, there are exactly 11 points for which $d_C = 12$. It turns out that the relationship between these two quantities is linear.
   Average: 0.2

Part B

1. Parts (a), (b) and (c) were done well. In (d), the most common error was writing $\sqrt{a^2 \check{} b^2} = a - b$. Many participants chose a value for a and then found the corresponding b then solved correctly, which could earn full marks.
   Average: 7.9

2. Most participants successfully completed (a) and (b). In (c), many noticed that $A + D = 3$ and $B + C = 8$ worked, but very few justified that these two equations were the only possibilities. Some participants did not realize that the digits B and C could be 0 when counting, while others listed out the 18 possibilities, but did not justify why these were the only possibilities. The correct count of 143 was rare in (d) and participants calculated this value by considering values for the digits, but did not complete the problem by arguing that distinct integers lead to distinct RD sums.
   Average: 3.3

3. Many participants had success and received full marks in (a) by completing Rows 7, 8, 9, and 10. In (b), a good number of participants were able to show why $n^2 - n$ satisfies all three properties, but had difficulties

explaining why $n^2 - 2n$ is not in Row $n - 1$. The final part of B3 on the CIMC is always a great challenge, and (c) did not disappoint. The key to this problem was to determine which rows required analysis, and then to show that if $n^2 - 10n$ appeared in one of those rows, it was always the case that $n \leq 30$.

Average: 1.4

CONCOURS CANADIEN DE MATHÉMATIQUES DE NIVEAU SUPÉRIEUR
Partie A

1. Les participants qui savaient quels petits nombres entiers étaient des nombres premiers ont assez bien réussi ce problème. Cependant, de nombreux participants ne savaient pas quels nombres entiers étaient nombres premiers et lesquels ne l'étaient pas. En particulier, 2 est un nombre premier, alors que 0 et 1 ne le sont pas. Certains participants ont trouvé les nombres premiers corrects dont la somme est égale à 31, mais ont oublié de les multiplier ensemble.
   Moyenne: 4,1

2. Ce problème a été bien réussi. Les erreurs les plus fréquentes étaient de laisser le 0 être le chiffre des centaines ou de ne pas laisser le 0 être le chiffre des dizaines.
   Moyenne: 3,9

3. La plupart des participants ont abordé ce problème visuellement et ont pu déterminer les coordonnées $(8, 15)$ comme une possibilité pour le point P. Certains ont eu des difficultés avec la symétrie de la deuxième réponse et ont placé l'autre possibilité pour le point P dans le mauvais quadrant. Les participants qui ont résolu ce problème de manière algébrique se sont généralement bien débrouillés ou ont fait de petites erreurs algébriques.
   Moyenne: 3,7

4. La plupart des participants ont obtenu l'équation $10x + 5y + z = 120$ et ont trouvé quelques triples ordonés possibles. Il a été plus difficile de trouver une méthode pour compter systématiquement tous ces triples. Parmi les erreurs les plus fréquentes, citons le fait de laisser x, y et z égaux à 0, de ne pas utiliser une approche systématique pour compter le nombre de triples ordonnés possibles et de faire des hypothèses incorrectes sur le modèle généré par le nombre de triples ordonnés possibles.
   Moyenne: 2,5

5. La plupart des participants qui ont tenté de résoudre ce problème ont procédé par essais et erreurs. Beaucoup ont réussi à trouver une ou deux paires en utilisant cette approche; cependant, certains élèves ont réussi à trouver les six solutions de cette façon. De nombreux participants ont factorisé $p^2 + 5p + 6$ en $(p+3)(p+2)$ et ont conclu que $p = -3$ ou $p = -2$. Ces élèves n'ont généralement trouvé que les paires $(0, -2)$, $(4, -2)$, $(0, -3)$, $(3, -3)$ et n'ont pas trouvé les paires $(3, 1)$ et $(4, 1)$. Les élèves qui ont résolu ce problème sans procéder par essais et erreurs ont pour la plupart procédé comme nous le faisons dans notre solution. Nous avons vu quelques solutions correctes où les élèves ont complété le carré pour obtenir une équation comme $(r-p)^2 + (r-6)^2 + (p+5)^2 = 49$, puis ont partagé 49 en une somme de carrés parfaits et ont analysé les cas.
   Moyenne: 0,9

6. La grande majorité des participants connaissait la formule du volume d'une pyramide à base carrée, mais la détermination des pyramides à considérer était l'étape clé de ce problème. Les participants qui ont réussi ont remarqué que le volume souhaité était composé de deux pyramides à base carrée, dont l'une est deux fois plus haute que l'autre. Des approches intéressantes ont été adoptées, utilisant des triangles similaires ou la trigonométrie pour déterminer les distances de divers segments de droite. En outre, les élèves qui ont traduit ou «projeté» le problème de dimension trois en un problème de dimension deux ont pu ensuite utiliser une approche de coordonées plus facilement.
   Moyenne: 0,5

Partie B

1. Les parties (a) et (b) ont été bien réussies. Les erreurs les plus fréquentes dans la partie (c) sont de ne pas reconnaître le triangle rectangle isocèle, et donc d'écrire des expressions incorrectes pour la longueur de AP, ou d'utiliser des relations de proportionnalité incorrectes entre les longueurs des côtés. Dans la partie (d), certains ont généré des expressions trop compliquées pour les aires des trapèzes et ont fait des erreurs algébriques en essayant de simplifier et de résoudre.
   Moyenne: 6,5

2. La partie (a) a été bien réussie. Une erreur fréquente a été de donner une réponse de $47 - 1 = 46$. Dans la partie (b), une erreur très fréquente était de ne pas reconnaître que la coordonnée x doit être un multiple de 3 pour que le point soit un point de réseau. Les participants ont alors calculé que $b = 74$. Cependant, la droite avec cette valeur de b n'aurait en fait que 5 points de réseau dans la région. La partie (c) était difficile et n'a pas été tentée par beaucoup de participants.
   Moyenne: 2,2

3. De nombreux participants ont obtenu la bonne réponse à la partie (a) en établissant et en résolvant correctement deux équations à deux inconnues. Certains participants ont pu déterminer une séquence valide dans la partie (b), mais prouver pourquoi elle était valide nécessitait plus de perspicacité et de soin dans leurs solutions. L'étape clé de la preuve consistait à montrer une contradiction qui apparaît lorsqu'un côté de l'équation est impair et l'autre pair. La partie (c) a rarement été tentée, bien que quelques participants aient tiré parti de leurs tentatives dans la partie (b) pour progresser dans la résolution de ce problème.
   Moyenne: 0,8

Comments on the Contests

CONCOURS CANADIEN DE MATHÉMATIQUES DE NIVEAU INTERMÉDIAIRE

Partie A

1. Ce problème a été très bien réussi. Presque tous les participants ont pu calculer correctement le temps écoulé.
   Moyenne: 4,8

2. Ce problème a été bien réussi. Les deux mauvaises réponses les plus courantes étaient 9 et $\frac{9}{4}$. Les erreurs d'arithmétique n'étaient pas rares. D'autres erreurs comprenaient l'interprétation de ♦ comme un nombre, et non comme une opération, ignorer la définition de l'opération ♦ et la traiter comme une multiplication normale, ou supposer que ♦ représentait soit une addition, soit une soustraction, soit une multiplication, soit une division, et d'essayer de trouver quelle opération il s'agissait.
   Moyenne: 4,7

3. Ce problème a été bien réussi. Certains participants n'ont pas trouvé les longueurs des côtés manquants et se sont contentés d'additionner les expressions des étiquettes existantes pour trouver le périmètre. Certains participants ont calculé le côté manquant du bas comme $5x + 1 - 3x$, sans savoir qu'ils devaient également soustraire 2. Certains participants n'ont déterminé qu'un seul des deux côtés manquants lors du calcul du périmètre. Certains participants ont commis des erreurs mathématiques en résolvant l'équation pour x. Certains participants n'ont pas compris ce que signifie le périmètre d'un polygone irrégulier.
   Moyenne: 4,1

4. Certains participants n'ont pas été en mesure d'analyser la question pour comprendre qu'ils devaient créer un cube plus grand pour traiter ses faces. Beaucoup ont essayé de résoudre la question en dessinant un patron. Cela n'a souvent abouti qu'à des notes partielles. De nombreux participants ont obtenu une réponse finale de 567 en additionnant les nombres sur toutes les faces des 27 petits cubes.
   Moyenne: 1,8

5. Cette question a posé des difficultés à plusieurs participants. Certains ont utilisé un temps de marche total de 7 heures, oubliant de soustraire l'heure de repos à R. D'autres ont calculé la distance totale parcourue de P à R et ont ensuite oublié de doubler cette distance pour le voyage de retour. Certains ont obtenu une équation correcte conduisant à la réponse finale, mais ont ensuite eu du mal à résoudre cette équation.
   Moyenne: 1,6

6. Il s'agissait d'un problème difficile. Dans l'ensemble, la plupart des participants ont eu du mal à reconnaître que l'expression de d_C dépend de la position du point C par rapport aux points A et B. Certains ont eu du succès en trouvant une tendance. Plus précisément, ils ont compté le nombre de points ayant des valeurs différentes (plus petites) de d_C. Par exemple, il y a exactement 11 points pour lesquels $d_C = 12$. Il s'avère que la relation entre ces deux quantités est linéaire.
   Moyenne: 0,2

Partie B

1. Les parties (a), (b) et (c) ont été bien réussies. Dans la partie (d), l'erreur la plus fréquente a été d'écrire $\sqrt{a^2 - b^2} = a - b$. De nombreux participants ont choisi une valeur pour a et ont ensuite trouvé le b correspondant, puis ont résolu correctement, ce qui pouvait permettre d'obtenir tous les points.
   Moyenne: 7,9

2. La plupart des participants ont complété les parties (a) et (b) avec succès. Dans la partie (c), beaucoup ont remarqué que $A + D = 3$ et $B + C = 8$ fonctionnaient, mais très peu ont justifié que ces deux équations étaient les seules possibilités. Certains participants n'ont pas réalisé que les chiffres B et C pouvaient être 0 lors du comptage, tandis que d'autres ont énuméré les 18 possibilités, mais n'ont pas justifié pourquoi il s'agissait des seules possibilités. Le compte correct de 143 était rare dans la partie (d) et les participants ont calculé cette valeur en considérant les valeurs des chiffres, mais n'ont pas complété le problème en argumentant que des nombres entiers distincts conduisent à des sommes RD distinctes.
   Moyenne: 3,3

Comments on the Contests

3. De nombreux participants ont réussi et obtenu la totalité des points dans la partie (a) en complétant les rangées 7, 8, 9 et 10. Dans la partie (b), un bon nombre de participants ont pu montrer pourquoi $n^2 - n$ satisfait aux trois propriétés, mais ont eu des difficultés à expliquer pourquoi $n^2 - 2n$ n'est pas dans la rangée $n - 1$. La dernière partie de B3 sur le CCMI est toujours un grand défi, et la partie (c) n'a pas déçu. La clé de ce problème était de déterminer quelles rangéss devaient être analysées, puis de montrer que si $n^2 - 10n$ apparaissait dans l'une de ces rangées, c'était toujours le cas que $n \leq 30$.
